mapping
KORMARC TO
BIBFRAME

Leader/06 w - Rare Book new type of resource

007/04 - f (skin) includes n–vellum & v–leather in MARC21

008 rare book Kwangkak, Geisun, Pangu, Yemi → ignore

012 – NLK Control Number l - identifiedBy - [Nlkc](#) - rdf:value

052 - NLK call number W - classification - [ClassificationNlk](#)

056 – Korean Decimal Classification W - classification – [ClassificationKdc](#)

246 2nd indicator- 9 original title same with 240 ▼a in MARC21
→ Work - expressionOf – Hub - title - Title – mainTitle, OR
→ W - title – VariantTitle - variantType - “original title”
- mainTitle - literal

Developing mapping KORMARCTO BIBFRAME

Local Field – item based processing

- 049 : Item - Item level mapping
- 090 : local call number – Item level mapping (It is similar to MARC21 obsolete 09x)

Field 049 - Holding

subfield	BIBFRAME mapping
	Item -
▼ a – holding organization	## - heldBy - Agent – http:// ... /vocabulary/organizations/ ... ; add bf:code "▼a content"
▼ l – item number	## - identifiedBy - rdfs:value "▼l content"
▼ v – volume	## - note - Note - rdfs:label "▼v content"
▼ c – copy	## - note - Note - rdfs:label "▼c content"
▼ f – location mark	## - physicalLocation - rdfs:label "▼f content"

090 – Local call number

subfield	BIBFRAME mapping
	Item - shelfMark - ShelfMark
▼ a – Classification number	## - classificationPortion - string
▼ b – Item number	## - itemPortion - ▼b content
▼ c – Volume number	Ignore → see 049 ▼c
▼ o – Authority record number	See Subfield ▼o spec
▼ f – location mark	## - physicalLocation - rdfs:label "▼f content"

Reuse, Develop or Publish URI for data value

- Reuse URI using language attributes

[example] ## -

<http://id.loc.gov/vocabulary/contentTypes/txt> ;

add lang="kor" rdfs:label "문자자료"

- Developing and publishing new URI for data values if there are no ID

example: URI for Leader/18 - KCR₃

URI for Korean library

URI for Place of publishing

URI for University code, et. al

Clear description in choosing among Conversion 1, 2

- For choosing among conversion options, condition must be clear
example : Field 245 there are 2 option
I - title – VariantTitle ← having field 240
W - title – VariantTitle ← not having field 240

Hub definition is not clear

- Leader/06 record type q – BibHub → W - rdf:type – Hub
- 130/240/7xx → Work - expressionOf – Hub

What source data will be?

- Future library base data is MARC data or BIBFRAME Linked data?
- But mapping is not all MARC data
 - There are many 'ignore'
 - 013(patent number), 018(copyright), 031(Musical incipits information), 066(Character sets present) et. al are not changed to BIBFRAME

Typo and late update

- 110/710/810 Subfield ▼0
identifiedBy - Identifier - rdf:value "number" ;
source - **source** - code "isni"
- Subfield ▼o-arrangement
- rdf:type - **bf:Arrangement**
- 700/710/711 Subfield ▼t – title of work
- title - Title - mainTitle – concatenate all subfield except ▼h, ▼i, ▼v, ▼w, ▼x, ▼0-8
→ ## - title - Title - mainTitle - concatenate all subfield except ▼h, ▼i, ~~▼v, ▼w~~, ▼x, ▼0-8
- 830 Subfield ▼a, ▼v
bflc:relationship - **bflc:Relationship - bflc:relation** -
→ relationship - Relationship - relation -
(bflc:Relationship, bflc:Relation, bflc:relationship, bflc:relation are moved to BF)

THANK YOU!
